                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNase
                                                                                                                                                                                                                                                                                                                                                                                                    a
                                                                                                                                                                                                                                                                                                            à
                                                              The invention describes a compound (I) 8-50 nucleobases in length targeted to a nucleic acid molecule (II) encoding RAIDD which is an adaptor molecule containing both death domain (DD) and caspase recruitment domains (CARD), where (I) specifically hybridises with and inhibits expression of RAIDD, or specifically hybridises with at least an encleobase portion of an active site on (II). (I) is useful for inhibiting the expression of RAIDD (Receptor interacting protein (RIP) associated ICH-I/CED-3-homologous protein with death domain) in cells or inhibiting the for treating an animal having a disease or condition associated with RAIDD, where the disease or condition is a hyperproliferative disorder such as cancer, or a growth or metabolic disorder. (I) is also useful for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. (I) is also susful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. This sequence represents a mouse RAIDD antisense oligonucleotide used to control expression of the RAIDD protein
                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                     The present invention describes a method for promoting the inhibition of polypeptide so that cleavage of an RNA strand of an oligonucleotide-RNA complex duplax occurs. Also described is a compound 8 to 50 mucleobases in length targeted to the nucleic acid encoding the human RNase HII polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HII polypeptide. The compound, which is an unrisense oligonucleotide, is useful for inhibiting the expression of a human RNase HII polypeptide in cells or tissues, as well as for treating an animal with a disease or condition associated with a human RNase HII polypeptide in cells or tissues, as well as for treating an animal with a disease or condition associated with a human RNase HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for readuring cellular RNA via antisense technology. The present sequence represents a human RNase HII antisense oligonucleotide, which is used in an example from the present invention
with a disease or condition associated with a human RNase H, for inhibiting the expression of a protein, or for reducing cellular RNA via antisense technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of a mammalian, particularly human, RNase H, for treating an animal with a disease or condition associated with a human RNase H, for inhibiting the expression of a protein, or for reducing cellular RNA via antisense technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /notes "2'-O-methoxyethyl gapmer with an 8 nucleotide deoxy gap and a phosphorothioate backbone; cytosine residues are 5-methyl cytosines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        H; antisense technology; inhibition; antisense oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·,
                                  The present invention describes a method for promoting the inhibition of the expression of a protein comprising employing a mammalian RNase H polypeptide so that cleavage of an RN Strand of an oligonucleotide-RNA complex duplex occurs. Also described is a compound 8 to 50 nucleobases in length targeted to the nucleic acid encoding the human RNase HII polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HII polypeptide is useful for inhibiting the expression of an antisense oligonucleotide, is useful for inhibiting the expression of treating an animal with a disease or condition associated with a human RNase HII polypeptide in the sacciated with a human RNase HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for reducing callular RNA via antisense technology. The present sequence represents a human RNase HII antisense oligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an oligonucleotide which targets polymucleotides encoding human aurora 2 kinase. The oligonucleotide inhibits aurora 2 kinase expression. The oligonucleotide is useful in the diagnosis and treatment of cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide targets and inhibits human aurora 2 kinase mRNA

The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite markers selected from a group of 185 such markers (A8022913-A802917). The invention also encompasses the use of left (A8022918-A8023107) and right (A8023103-A802327) primers to of left (A8022918-A8023107) and right (A8023103-A802327) primers to complete the microsatellite markers and to identify genes responsible for a phenotypic trait of interest in wheat. Wheat is an allohexaploid species consisting of 3 diploid genomes designated A, B and C responsible for a phenotypic trait of interest in wheat. Wheat is an office allohexaploid species consisting of 3 diploid genomes designated A, B and C b, resulting from two successive intercrossings involving at least three different species. The D genome is thought to have been introduced in the most recent intercrossing, between the ampliploid AABB and Triticum tauschil (DD), probably involving only a limited number of genome, and its low level of polymorphism, the genetic mapping of wheat has to date been difficult. Microsatellites are tandemely repeated sequences between one and six nuclectides long, and are very polymorphic in length contracted to polymorphism makes them especially suitable for the genetic mapping of species which show little intraspecies polymorphism, such as wheat. In addition, microsatellite anterest of the invention are comminged from the ancestral diploid donor species Triticum tauschil and genomes. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome of the invention are useful for identifying genes responsible for a phenotypic canneaution are useful for identifying genes responsible for a phenotypic particular they may be used for analysing genes and alleles implicated in disease and for identifying development factors, quality factors and conferring resistance to pathogens and xenobictics. (I) has cytostatic, osteopathic, cardiant and vasctropic activities, and can be used in gene therapy and vaccine production. (I) is useful for identifying an agent that binds to (I), by contacting (I) with an agent and assaying the contacted mixture to determine whether a complex is formed with the agent bound to the peptide. A polynucleotide (II), encoding (I), is useful in the development of diagnostics and therapies for diseases and disorders
          mapping and genotyping diploid and polyploid species of Triticum, particularly Aegilops, Triticum monococcum, Triticum durum, Triticum aestivum, or related species; for identifying cultivars and hybrids of Triticum and related species; for assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises wheat or a related species; and to assess whether or not a product comprises genetically modified wheat. The present sequence represents a specifically claimed Triticum tauschii/wheat genome D microsatellite marker right PCR primer of the invention. (Updated on 29-MUG-2003 to standardise OS fleid)

mediated/modulated by an oestrogen receptor (ER). (II) is also useful in gene therapy for treating cancer, osteoporosis and cardiovascular diseases. The human ESR-alpha gene is located on chromosome 6. ABA89973 to ABA9010 represent PCR primers, and ABA90011 to ABA90037 represent sequencing primers, for the human ESR-alpha gene, which are used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                              for modulating the expression of calreticulin. The compositions comprise antisense compounds, particularly antisense oligonucleotides, targetted to nucleic acids encoding calreticulin. The antisense compound is useful for inhibiting the expression of calreticulin in human calls or tissues. It is also useful for treating a human having a disease or condition cancer, autoimmune disease, viral infection or cardiovascular disease, pinhibiting expression of calreticulin. It is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. It is also used in antisense therapy. The present sequence is an antisense compound targetted to human calreticulin. This sequence is an antisense compound antisense inhibition of calreticulin expression-phosphorothioate 2'-MOB
                                                                                                                                                                                               Novel antisense compound targeted to nucleic acid encoding calreticulin, useful for treating a human having disease or condition associated with calreticulin e.g. cancer, viral infection, autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;
                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods

multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (a) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker comultiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the marking in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected from the detected from the detected from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed respectively is useful for gene analysis. ABL42957 to ABL45322 represent correspondent for human chromosome 21q22.1, which are PERFERENT or human chromosome 21q22.1, which are specifically claimers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
present invention describes a method of arraying genome clones. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; mouse; murine; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

ó,

screening of candidate pharmaceutical agents, where high-throughput screening techniques are employed. (II) is useful to detect and quantitate gene expression in biological samples. Oligonucleotides or longer fragments derived from (II) are useful as probes in a microarray used to monitor the expression level of large number of genes. (I)-(III) are useful for the study of the function of a GABA receptor, to study the mechanism of the disease as related to GABA receptor, for the creation of the evaluation of potential therapeutic interventions. ABKZ7339 represent mutant gamma-minobutyric acid receptor subunit coding

length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TWFR1), where the antisense compound inhibiting expression of TWFR1. The antisense compound is useful for inhibiting the expression of TWFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TWFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TWFR1. The antisense compound is useful for diagnostics, therapeutics, prophylasis and as research reagents and kits. This polynucleotide sequence represents a mouse oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant gamma-aminobutyric acid receptor GABARD subunit PCR primer #15

                                                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide primer useful for polymerase chain reaction-based detection of Mycosphaerella species, a banana fungal pathogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                chain reaction (PCR) based detection of a Mycosphaerella sp., a fungal pathogen of bandar. The method involves isolating DNA from a plant tissu infected with Mycosphaerella sp., amplifying a part of ITS (internal transcribed spacer) sequence using the DNA as template in PCR with the specified primer pairs and detecting Mycosphaerella sp. by visualizing the amplified part of ITS sequence. The primers enable the detection of specific isolates of fungal pathogens and the monitoring of disease development in plant populations. Sequences ABA94546-549 represent ribosomal gene-specific for the ITS regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to oligonucleotide primers for use in polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 2 A; 6 C; 5 G; 7 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 4; Page 23; 27pp; English.

DB 1; Length 20; Score 14.2; 0.8%; Query Match

The invention relates to an isolated mammalian polypeptide (I), which is a mutant of gamma aminobutyric acid (GABA) receptor subunit. The mutation distripts the functioning of an assembled GABA receptor, its functional fragment or homologue, and creates a phenotype of epilepsy, anxiety, manic depression, phobic obsessive symptoms, Alzheimer's disease, schizophrenia, migraine and/or obesity. (I), the polymucleotide (I) encoding (I) and antibody (III) to (I) are useful in the diagnosis of epilepsy, anxiety, manic depression, phobic obsessive symptoms. Alzheimer's disease, schizophrenia, migraine and/or obesity. (III) is useful for treating the above conditions. (I)-(III) are useful in

Mutant gamma-aminobutyric acid receptor subunits and DNA molecule, useful for diagnosing epilepsy, Alzheimer's disease, mígraine, obesity, anxiety, manic depression and schizophrenia.

Ribosome RNA gene base sequence of Cordyceps sinensis for classification of seeds of Cordyceps sinensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ribosome RNA gene base sequence of Cordyceps sinensis for classification of seeds of Cordyceps sinensis.
                                                                                                      Ribosome ribonucleic acid; rRNA; Cordyceps crassispora; classification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel base sequence which is part of a fully defined ribosome ribonuclaic acid (KRNA) gene of Cordyceps crassispora. The base sequences can be used for the classification of Cordyceps sinensis. The sequence represents a PCR primer used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ribosome ribonucleic acid; rRNA; Cordyceps crassispora; classification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to oligonuclectide primers for use in polymerase than reaction (PCR)-based detection of a Mycosphaerella sp., a fungal pathogen of banana. The method involves isolating DNA from a plant tissue infected with Mycosphaerella sp., amplifying a part of ITS (internal transcribed spacer) sequence using the DNA as template in PCR with the specified primer pairs and detecting Mycosphaerella sp. by visualizing the amplified part of ITS sequence. The primers enable the detection of specific isolates of fungal pathogens and the monitoring of disease development in plant populations. Sequence ABA94546-549 represent ribosomal gene-specific primers synthesised for testing in combination with the primers specific for the ITS regions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide primer useful for polymerase chain reaction-based detection of Mycosphaerella species, a banana fungal pathogen.

                                                                                 0;
             The invention relates to a novel base sequence which is part of a fully defined ribosome ribonucleic acid (rRNA) gene of Cordyceps crassispora. The base sequences can be used for the classification of Cordyceps sinensis. The sequence represents a PCR primer used in the invention
                                                                                                                                                                                                             Human, E2F transcription factor 2, hyperproliferative disorder, cancer, developmental disorder, antisense, therapy, phosphorothioate backbone;

The present invention relates to antisense oligonuclectides, compounds and methods for modulating the expression of E2F transcription factor 2. The antisense oligonuclectides specifically hybridise with and inhibit the expression of E2F transcription factor 2. They are useful for inhibiting the expression of E2F transcription factor 2 and for treating diseases or conditions associated with E2F transcription factor 2, such as hyperpolliferative disorders, particularly cancer and developmental disorders. They may also be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway and in the treatment of a disease or disorder which can be treated by modulating the expression of E2F transcription factor 2. The oligomeric compounds, particularly the antisense oligonucleotides encoding E2F transcription factor 2, ultimately modulating the amount of E2F transcription factor produced. Sequences of the invention are also used in antisense therapy. The present DNA sequence is human E2F transcription factor 2 antisense oligonucleotide with a phosphorothioate backbone. This sequence is targetted to the coding region of human E2F transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bovine; immunological rejection; nuclear transfer; NT; immune response; MHC-I; major histocompatibility complex; embryo transfer; PCR; primer; MHC class I exon 2 DNA; ss.

The invention describes a compound, 8-50 nucleobases in length targeted to a nucleic acid molecule encoding human TERT (telomerase reverse transcriptase), where the compound specifically hybridises with and inhibits the expression of TERT, a series of oligonucleotides were compound for the human TERT RNA. These were 20 nucleotides in length and composed of a central gap region consisting of the 12-deoxynucleotides, flanked on both sides ($' and 3' directions) by five-nucleotide wings. The wings were composed of 2' methoxyethyl (2' MOB) nucleotides in the compounds were analysed for their effect on human TERT mRNA levels by reverse transcriptase (RT)-polymerase chain reaction (PCR). The compound is useful for inhibiting the expression of TERT in associated with TERT, for modulating apoptosis, for inhibiting cell growth (preferably, cancer cell growth), in antisense therapy and for diagonucleotide used to modulate the activity of nucleic acid molecules encoding TERT, described in the method of the invention
transcriptase (TERT), which specifically hybridizes with and inhibits expression of TERT, useful for modulating apoptosis and inhibiting cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, K-ras, PCR primer; probe, capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1, BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome, obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method (M1) for designing capture

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of minimising immunological transfer (NT) foctus by transferring a nuclear transfer (NT) foctus by transferring a nuclear transfer embryo into an embryo recipient under conditions effective for the development of a nuclear transfer foctus with minimal risk of minumulogical rejection of the foctus due to materanal anti-foctal major histocompatibility complex (MHG)-I immune response. The method is useful for minimising immunological rejection of a NT foctus. It is also useful for parforming embryo transfer. The present DNA sequence is a PCR primer which is used for amplifying bovine MHC class I exon 2 DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Telomerase reverse transcriptase, TERT, cytostatic, apoptosis, cell growth inhibitor; antisense oligonucleotide, antisense technology;
                                                                                                                                                                                                                           יישות במונים ומשתחוס logical rejection of nuclear transfer fetuses, by transferring the nuclear transfer embryo into an embryo recipient for development of the fetus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compound targeted to nucleic acid molecule encoding telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Telomerase reverse transcriptase, antisense oligonucleotide #76.

oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where clip wave melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of a Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and appergillus funigatus, viruses e.g. T-cell lymphocytotrophis citus, Epstein-Barr virus and pollo virus, and parasitic infectious agents celected from Onchoverva volvulus. Entameba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, furner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes or genes involved in DNA amplification, replication, recombination or repair, the nethod is also used for environmental monitoring, forensics and the food and the all passes canning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonuclectide probe particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and infrared microscope and i

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
```

The present invention describes a method (M1) for designing capture

```
oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where clid wave melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonalla, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents and color with a monocytogenes and Haemophilus influenza, fungal specially fundatus, viruses e.g. T-cell lymphocytotrophis citus, Epstein-Barr virus and pollor virus, and parashite infectious agents selected from Onchoverva volvulus. Brianceba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such so 1 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and for environmental monitoring (using e.g. scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe presence or absence of the target nucleotide sequences. AB192074 to AB19546 represent oligonucleotide sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of salmonella, listeria monocytogenes and Heemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Appergillus funigatus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents celected from Onchoverva volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p33 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and federating comprises scanning quing e.g. as scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets.

MENDALA COLUME and confidention sequences. ABIS2074 to a presence or absence of the target nucleotide sequences. ABIS2074 to a ball of the contraction of the exemplification.

            The invention relates to novel human oestrogen receptor variant peptides, and the polymucleotides encoding them. The peptides of the invention have cytostatic, osteopathic and cardiant activity. The peptides of the invention are useful to mediate or modulate a variety of disorders such as a susceptibility to cancer, osteoporosis, cardiovascular disorder, sequences shown in ABQ97682-ABQ9719 represent PCR primers used in the invention to amplify individual exons of the human oestrogen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel antisense compound, which is 8-10 calceledies in length targeted to a nucleic acid molecule encoding human calreticulis, and specifically hybridises with and inhibits the expression of human calreticulin. A compound of the invention has expression of human calreticulin. A compound of the invention has and may act as a calreticulin-inhibitor, and have a use in antisense gene therapy. The antisense compound is useful for treating a disease or condition associated with calreticulin e.g. melanoma, viral warts, rubella, schiscosomiasis, congenital heart block or osteoporosis. The present sequence is useful as prophylaxis, research research and diagnostic. The present sequence is used in the exemplification of the invention. The sequence is a phosphorothioate oligonucleotide, having 2'MOS wings and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound that specifically hybridizes with and inhibits the expression of human calreticulin, useful for treating diseases e.g. osteoporosis or schistosomiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; human; antisense compound; calreticulin; cytostatic; cardiant; virucide; osteopathic; antiparasitic; antisense gene therapy; melanoma; viral warts; rubella; schistosomiasis; congenital heart block;

This invention relates to a novel nucleic acids, and encoded polypeptides continuously which have properties related to the stimulation of biochemical responses in a cell, tissue, organ or organism.

or physiological responses in a cell, tissue, organ or organism.

continuously, it refers to the use of biologically active fragments for specifically, it refers to the use of biologically active fragments for diagnostic and prognostic assays and furthermore in the treatment of diverse pathological conditions. The present invention describes novel diverse pathological conditions. The present invention describes novel and multiple as methods to modulate their hamped and multiple and eligos, ribozymes and peptide nucleic acids.

Context, cancer, cardionant for treating metabolic disorders, diamente context, cancer, cardiovascular, infectious, neurodespenerative, immune and hammatopoietic diseases as well as various dyslipidaemias.

Context, cancer, cardious have many activities including anorectic, and haematopoietic diseases as well as various dyslipidaemias.

Context, these molecules have many activities including anorectic, contentify small molecules that modulate or inhibit, for example, contenting and cardiant. Furthermore, they are useful in screening assays anabolic and cardiant. Furthermore, they are useful in screening assays anabolic and cardiant. Furthermore, they are useful in corcening act as a context as in chromosome mapping, tissue typing, preventive medicine and cut of pharmacogenomics. This oligonucleotide is a PCR primer used to amplify human NOVX DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX associated disorders, e.g. cancer, cardiomyopathy, atheroscierosis, or diabetes, and in chromosome mapping, tissue typing or

The invention relates to an antisense compound that is targeted to a nucleic acid encoding inhibitor.kappa B kinase-gamma, specifically and inhibiting its expression. Compounds of the invention are antisense coligonucleotides comprising at least one modified internucleoside comprising at least one modified internucleoside moiety, which is a P-O-methoxyethyl sugar moiety, or at least one modified nucleobase, which is a 5-O-methoxyethyl sugar moiety, or at least one modified nucleobase, which is a 5-methyloytosine. Preferably, the cutiense oligonucleotide is a chimeric oligonucleotide. The compound of the invention is useful for preparing a composition for treating a chifammatory disorder. The methods are useful for inhibiting the capters of inhibitor-kappa B kinase-gamma in cells or tissues, and creating an animal having a disease or condition associated with creating an animal having a disease or condition associated with crepresent antisense oligonucleotides for the inhibitor-kappa B kinase-gamma. Sequences given in ADA44713 ADA44790 crepresent antisense oligonucleotides for the inhibition of human any and an animal having a disease or condition of human and an animal having a disease or condition associated with a condition of human and an animal having a disease or condition of human and an animal having a disease or condition associated with a condition and animal having a disease or condition of human and an animal having a disease or several and animal having a disease or condition associated with a condition and animal having a disease or condition associated with a condition of human and a sequence given in ADA44713 ADA44790 creating an animal having a disease or condition of human and an animal having a disease or condition and animal having a disease or condition of human and an animal having a disease or condition of human and an animal having a disease or condition of human and animal having a disease or condition and animal having a disease or condition of human and animal having a disease or condi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compound having sequence targeted to nucleic acid encoding inhibitor-kappa B kinase-gamma, useful for preparing composition for treating e.g., cancer, or inflammatory or autoimmune disorder.
                                                                                             Antisense oligonucleotide; cytostatic; immunosuppressive; antiinflammatory; gene therapy; hyperproliferative disorder; cancer; autoimmune; inflammatory disorder; inhibitor-kappa B kinase-gamma; ss;

The invention relates to a novel compound of 8 - 50 nucleobases in length targeted to a nucleic acid molecule encoding a short heterodimer partner—1. The novel compound specifically hybridizes with a nucleic acid expression of the nucleic acid expression of the nucleic acid molecule. The compound, and a composition comprising it are useful for treating a disease or condition associated abnormal lipid or cholesterol metabolism such as atherosciercism or addition associated abnormal lipid or cholesterol metabolism such as atherosciercism or addition involving cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of short heterodimer partner—1. They can also be useful prophylactically in preventing or delaying infection, and the numeral manner of the contraction of the numeral manner of the numeral manner of the numeral manner of the numeral manner of the numeral numeral manner of the numeral numera

The present invention describes a compound 8-50 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding Kinses suppressor of ras-1 (KiSR), and inhibits the molecule encoding Kinses in length that specifically hybridises with at least an 8-nucleobase in length that specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleocate acid molecule encoding KiR; (2) a composition comprising the compound and a carrier or diluent; (3) inhibiting the expression of KSR in cells or tissues by contacting the compound so that expression of KSR is inhibited; and (4) treating an animal having a disease or condition associated with KSR by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of KSR is inhibitor, and in antisense gene therapy. The compound, composition and methods are useful for treating a disease or condition associated with KSR, such a sising from aberrant apoptosis by inhibiting the expression of KSR. They are also useful in research and diagnostics for modulating the expression of KSR. The present sequence represents a chimeric phosphorothioate from the compound of human KSR, which is used in an example from
                                                                     Human, kinase suppressor of ras-1; KSR; cytostatic; KSR inhibitor; antisense gene therapy; hyperproliferative disorder; phosphorothioate; developmental disorder; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding KSR, useful for treating a disease/condition associated with KSR, such as hyperproliferative or developmental disorders.
                                     Human KSR chimeric phosphorothioate oligonucleotide SEQ ID NO:73.

```
This invention relates to the detection of a fungal pathogen comprising isolating DNA from a plant leaf infected with a pathogen. The methods and primers are useful for identifying fungal isolates of fungal pathogens and monitoring of disease development in plant populations. The present sequence represents an oligonucleotide primer used to detect Fusarium ear
                                                                                                                                                                                                                                                                                                                                                                     Detecting a fungal pathogen, useful for monitoring disease development, comprises subjecting the DNA to PCR amplification using at least one primer having sequence identity with at least 10 contiguous nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The methods and primers are useful for identifying fungal isolates of fungal pathogens and monitoring of disease development in plant populations. The present sequence represents an oligonucleotide primer used to detect Fusarium ear

coding region, intron region, exon region, stop codon, intron:exon region, exon region, exon region, exon region, exon region, exon region, or stop codon, intron:exon junction, or stop reactivities and which conservation intron and inhibits the expression of Bro-c. (I) specifically hybridises with and inhibits the expression of Bro-c. (I) have cytostatic, antiinflammatory, osteopathic and antibacterial cartivities, and can be used for modulating the expression of src-cand for treating diseases or conditions associated with expression of cand for treating diseases or conditions associated with expression of src-c, e.g. aberrant bone remodeling or hyperproliferative disorders, or and for treating or bycerproliferative disorders, cancer, owarian cancer, oesophageal cancer, neuroblastoma, retinoblastoma cancer, ovarian cancer, oesophageal cancer, neuroblastoma, retinoblastoma cancer, ovarian cancer, osophageal cancer, neuroblastoma, retinoblastoma cancer, response to delay infection, inflammation or tumour prophylaxis, e.g. to prevent or delay infection, inflammation or tumour companies of various members of a biological pathway. The present companies of various members of a biological pathway. The present continoned continoned continoned in an example from the present invention continoned in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; rat; Jun N-terminal kinase; JNK1; JNK2; JNK3; antisense; cytostatic; antiinflammatory; apoptosis; prostate cancer; prostate tumour; inflammation; fibrosis; fibrotic disease; fibrotic scarring; peritoneal adhesion; lung fibrosis; conjunctival scarring; hyperproliferative disease; cancer; probe.

The invention relates to an oligonucleotide (antisense, AS) comprising 8-
30 nucleotides connected by covalent linkages, where the oligonucleotide
30 nucleotides connected by covalent linkages, where the oligonucleotide
30 nucleotides connected by protein and andulates the expression of the
30 Jun N-terminal kinase (JNK) protein and andulates the expression of the
30 Jun N-terminal kinase (JNK) protein and andulates on comprising
31 carrier), treating an animal having/suspected of having/prone to having a
32 carrier), treating an animal having/suspected of having/prone to having a
33 carrier), treating an animal having/suspected of having/prone to having
34 carrier), treating an animal having/suspected of having/prone to having
35 carrier), treating an animal having/suspected of having/prone to having
36 carrier, therapeutic amount of the composition of the AS oligonucleotide,
37 contacting the expression of a JNK protein of the AS oligonucleotide,
38 contacting the expression of a JNK protein, or expression of a protein that
38 prompted by a JNK protein, or expression of a cellular protein that
39 condition associated by a LNK protein, or expression of a cellular protein of a naminal by administering the oligonucleotide to the cells or the cells of the contacting a propholation and treating a human having a disease or condition associated with a JNK protein or characterised by a reduction in apoptosis, such as a classes or condition (e.g. tibrocis carring, peritoneal adhesions, lung disease or condition (e.g. tibrocis carring, peritoneal adhesions, lung tibrosis or conjunctival scarring), hyperproliferative disease or condition (e.g. tibrocis carring, peritoneal adhesions, lung tibrosis or conjunctival scarring), hyperproliferative disease or condition (e.g. tibrocis carring, peritoneal adhesions, lung tibrosis or condition (e.g. tibrocis carring, peritoneal adhesions, lung scarring), hyperproliferative disease or condition (e.g. tibrocis carring, peritoneal adhesions, lung scarring), hyperprolifer mucleic aci
                                                                                                                                                                                                      New oligonucleotides which hybridizes to, and modulates the expression of Jun N-terminal kinase, useful for treating a disease or condition characterized by a reduction in apoptosis, e.g. prostate cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense; interferon gamma receptor 2; autoimmune disorder; cancer; autoimmune thyroiditis; autoimmune insulinitis; multiple sclerosis; diabetes; autoimmune arthritis; Crohn's disease; apoptosis; IFNGR2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;

                                                                     Homo
             The invention relates to antisense compounds, composition and methods for modulating the expression of human interferon gamma receptor 2 (IFNGR2). The compositions comprise antisense compounds targetted to nucleic acids treating diseases or conditions associated with IFNGR2, e.g. autoimmune thyroiditis, diabetes, multiple sclerosis, autoimmune atthritis, autoimmune insulinitis or Crohn's disease), cancer, for a disease/disorder caused by aberrant apoptosis. They are also useful kits. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR2 DNA
                                                                                                     /note= "Phosphorothioate backbone; All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides for modulating Interferon gamma receptor 2, particularly useful for treating autoimmune disorders (e.g. multiple sclerosis or Crohn's disease), cancers or diseases caused by aberrant apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.8%; Score 14.2; DB 1; Length 20; 4.2%; Pred. The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions hyperproliferative disorders, such as developmental disorders or hyperproliferative disorders, sepecially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                             patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a novel fermentation process to be used in the production of exocellular pravastatin and lovastatin which comprises cultivating microorganisms from Aspergillus and Monascus species. Statins cultivating microorganisms from Aspergillus and Monascus species. Statins are fungal secondary metabolites which inhibit hydroxy-methylglutaryl coenzyme A (Hand-CoA) reductase, the first committed enzyme of cholesterol coenzyme A fland-CoA) reductase, the first committed enzyme of cholesterol synthesis. Statins are therefore used as cholesterol-lowering drugs. The gravastatin, either in a cell-associated form or releasable into the pravastatin, directly, as a secondary metabolite, in the fermentation culture medium. Those production processes currently in existence culture medium. Those production which wise the process culture fermentation of complex carbon monascus ruber. In addition, the process uses simple and complex carbon sources obtained from agricultural waste thereby reducing production costs. The current sequence is that of the fungal universal ITS3 PCR primer of the invention which was used to amplify the Aspergillus terreus
                                                                        Fungal; ITS3; interspace 3 region; ss; fermentation process; lovastatin;
exocellular pravastatin production; statin; HMG-CoA; primer; PCR;
cholesterol synthesis; cholesterol-lowering drug;
hydroxy-methylglutaryl coenzyme A reductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fermentation useful for producing pravastatin involves pre-fermenting fungal strain in first nutrient medium, and then fermenting strain in second nutrient medium.
                                     Fungal universal ITS3 PCR primer - used to amplify ITS2 region DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primer #14 for human oestrogen receptor alpha (ESR1) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; oestrogen receptor alpha; ESR1; cancer; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 20 BP; 7 A; 5 C; 6 G; 2 T; 0 U; 0 Other;

a sample, methods of determining a risk of having or developing a disorder mediated by a variant oestrogen receptor and methods for screening compounds useful for treating such disorders. ABX33718-ABX3375s represent PCR primers for the human BSR1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the sequencing of genomic DNA encoding human human oestrogen receptor alpha (ESR1) protein. The gene encoding human ESR1 is located on chromosome 6. The invention provides the genomic structure of the ESR1 gene and novel single nucleotide polymorphisms (SRPs) Maplotypes in the genes. The polymorphisms/haphotypes can lead to a variety of disorders (such as cancer, osteoporosis, and cardiovascular disorders) that are mediated by a variant oestrogen receptor. The invention provides methods of detecting ESR1 polymorphisms/haplotypes in invention provides methods of detecting ESR1 polymorphisms/haplotypes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide sequence of 5'-biotin-labeled universal capture probe ITS3-B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dimorphic fungus; internal transcribed spacer-2; ITS2; fungal infection;

                                                                                                                                                                                                                                                                                                                                                                                                                  sample, where the presence of the ITS2 nucleic acid sequence indicates the sample was contacted by the dimorphic fungus. The method is useful for detecting or diagnosing fungal infections. The array is useful screening a sample for the presence of, or contamination by a dimorphic fungus. The present sequence represents a 5' biotin-labeled universal capture probe, used for detecting a dimorphic fungus
                                                                                                                                                                                                                                Detecting a dimorphic fungus, useful for diagnosing fungal infections, comprises detecting the presence or absence of an internal transcribed spacer-2 (ITS2) nucleic acid sequence of a dimorphic fungus within a
                                                                                                                                                                                                                                                                                                                                                              The invention relates to detecting a dimorphic fungus. The method involves detecting the presence or absence of an internal transcribed spacer-2 (ITS2) nucleic acid sequence of a dimorphic fungus within a

where the compound specifically hybridises with the nucleic acid molecule and inhibites expression of ATM or specifically hybridises with the nucleic acid molecule portion of an active site on the nucleic acid molecule. The invention is useful for inhibiting the expression of ATM in cells or tissues. The invention is useful for treating an animal with hyperproliferative or therapeutics, prophylaxis, as research reagents and kits, for therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway and e.g., to prevent or delay infection, inflammation or tumour formation. The present sequence is an antisense oligo targetted to human ABC transporter MHC I DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                New antisense compound that hybridizes and inhibits the nucleic acid encoding ABC transporter major histocompatibility complex 1, for treating diseases or conditions such as a hyperproliferative or autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound targetted to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1..20

                                                                                                                                                                                                                                          The invention relates to antisense compounds targetted to a nucleic acid encoding human MyD88 (myeloid differentiation primary response gene 88) to inhibits its expression. Antisense compounds of the invention are useful for preparing a composition for treating neurodegenerative disease e.g. Alzheimer's disease, Down's syndrome or schizophrenia. The invention is also useful in gene therapy. The present sequence is an antisense oligonucleotide targetted to human MyD88 DNA

                                                                                                                                                The invention relates to a novel DNA encoding a weed controller metabolism protein. A protein of the invention has herbicide activity. The proteins and their encoded genes are useful e.g. in constructing new breeds of herbicide-resistant plants and also in developing various agrochemicals. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense; ss; human; CD81; TAPA-1; tetraspanin; viral infection; cocaine addiction; autoimmune disorder; antiinflammatory; antibacterial; virucide; antiparasitic; inflammatory disorder; parasitic infection; bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /mod_base= OTHER
/note= "Phosphorothioate backbone and all cytidines are
-methyl cytidines"
Weed controller metabolism proteins deactivating porphyrinogen oxidase (PPO)-inhibiting herbicides by N-demethylation and their genes, useful e.g. in constructing new breeds of herbicide-resistant plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a compound (antisense oligonucleotide) ... hybridising with the eighth nucleobase portion of an active site on a nucleic acid molecule encoding CD81 (Also known as TAPA-1, a tetraspanin) comprising the expression of CD81. Also included is a composition emposition the antisense oligonucleotide and a carrier or a diluent. The antisense oligonucleotide is useful for inhibiting the expression of CD81 in cells or tissues. The antisense oligonucleotide is also useful for treating infections preferably viral, bacterial and parasitic and diseases such as inflammatory disorders and autoimmune disorders. The
Novel compound hybridizing with nucleic acid molecule encoding CDB1 and inhibiting the expression of CDB1, useful for treating infections and disease associated with expression of CDB1 such as inflammation disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Phosphorothioate backbone, All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; antisense; pituitary tumour-transforming gene; securin; cancer;

                                                                                                                                                       invention relates to novel antisense compounds targetted to a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention Further relates to: an oligonucleotide containing single uncleotide further relates to: an oligonucleotide containing single uncleotide fragments from any one of 1220 fully defined sequences as given in a specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for
                                                                                                                                                                     acid encoding (pituitary tumour-transforming gene) FTTGI (also known as securin, TUTRI and ESP-I associated protein) to inhibit its expression. Antisense compounds of the invention are useful for preparing compositions for treating pituitary, breast, colorectal, testicular, pulmonary and epithelial cancer. The invention is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human PTTGI DNA. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                               New compound, having a sequence targeted to a nucleic acid encoding PTTG1, useful for preparing a composition for treating e.g. pitultary, colorectal, breast, testicular, pulmonary or epithelial cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                   Nyce JW,
 The present invention relates to a method for detecting microorganisms using primers (ADF90918-ADF91145). The method is used for detecting microorganisms (bacteria, fungi, protozoa, viruses) which cause diarrhoea symptoms, and pathogenic microbe (bod poisoning. The method can be used to detect unspecified microbes, or specific pathogens, or for the simultaneous detection of many kinds of microorganism.
                                                                                                                                           ..
diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rapid, sensitive detection of specific or unspecified microbes causing diarrhea and food poisoning, using primers which target universal and specific genes, and amplifying by PCR under heat cycle conditions suitable for many detections.
                                                                                                                                             Gaps

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, comprising an genomic flanking regions, comparisons of second active agent comprising an associated within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or continifiammatory steroid and ubiquinone. A composition of the invention and as second active agent comprising an antisines gene therapy. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a composition are prophylactic or therapeutic respiratory effect of an for enhancing the prophylactic or therapeutic respiratory of an entiinflammatory steroid in a subject, for reducing or depleting levels of continional continuous surfactant in a subject, for reducing or depleting levels of inguinone or receptor, producing bronchodilation, increasing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Ung inflammation, but was obtained in electronic format directly from WIPO

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the confinitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an continiflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, confirmunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or the preventing a respiratory, lung or mallignant disease or condition, also continiflammatory steroid in a subject; for reducing or depleting levels of of, or reducing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject; for reducing levels of adenosine of, or receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

Condition in the sequence data for this patent is not represented in the printed secretic attention in the printed and the printed of the condition of the con ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antihillammatory steroid and ubiquinone. A composition of the invention antibiliammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing arespiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of antiinflammatory steroid in a subject, for reducing levels of acceptor, producing bronchodilation, increasing levels of adenosine increasing levels of increasing i lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 509; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, continuity and a second active agent comprising an antistration sof genes encoding a polypeptide associated with lung and/or compariant and a second active agent comprising an antistral mamatory steroid and ubiquinone. A composition of the invention as antiinflammatory antiallergic, antiasthmatic, hypotensive, conse in antisense gene therapy. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a conse in antisense gene therapy. The composition may have a consent a respiratory, lung or malignant disease or condition, also continuially a respiratory. Lung or therapeutic respiratory effect of an for enhancing the prophylactic or therapeutic respiratory effect of an antisinal prophylactic or therapeutic respiratory disection or receptor, producing bronchodilation, increasing levels of adenosine or receptor, producing bronchodilation, increasing levels of ubiquinone or corporated time subject is tissue, or treating bronchoconstriction, congruent in a subject is tissue, or treating bronchoconstriction, but was obtained or a respiratory disease or condition. Specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has Oilgo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 19; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention and antisense gene therapy. The composition of the invention of preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an coff or reducing sensitivity to adenosine, reducing or depleting levels of or receptor, producing bronchodilation, increasing levels of adenosine or receptor, producing bronchodilation, increasing levels of ubiquinone or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, stissue, or treating bronchoconstriction. Unug allergies, or a respiratory disease or condition. Successing the sequence date for this patent is not represented in the printed segment of the printed or presented in the printed or precent of the printed or presented in the printed or presented in the printed or precent or presented in the printed or presented in the printed or precent or presented in the printed or presented at ftp.wipo.int/pub/published_pct_sequences

Katz E, Pabalan J, Aguilar D; Sandrasagra A, Ka L, Shahabuddin S; Li Y, San Tang L, Miller S, Nyce JW,

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has Oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 2751; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, or regions within 2-10 nucleotides of 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or antihifammatory steroid and ubiquinone. A composition of the invention has antihifammatory; antiallargic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a communosuppressive, and cytostatic activity. The composition may have a conservation of preventing a respiratory, lung or malignant disease or condition, also preventing the prophylactic or therapeutic respiratory effect of an antihifammatory steroid in a subject, for reducing levels of adenosine of or receptor, producing bronchodilation, increasing levels of adenosine or lung surfactant in a subject, stissue, or treating bronchoconstriction, lung a surfactant in a subject stassue, or treating bronchoconstriction, lung a surfactant in a subject stassue, or treating bronchoconstriction, lung a surfactant in a subject, stissue, or treating bronchoconstriction, lung a surfactant in a subject, stissue, or treating bronchoconstriction, is not represented in the printed lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers ABV77013-16 represent conserved primers designed for amplification of the fungal nuclear ribosomal RNA internal transcribed spacer (ITS) region. The primers are useful for detecting a fungal pathogen such as Colletotrichum acutatum, Alternaria spp. or Cladosporium carpophilum. The primers are useful for detecting specific isolates of fungal pathogens and for monitoring disease development in plant populations, for assessing potential damage in a specific crop variety/pathogen strain relationship, for providing detailed information on the development and spread of specific pathogen races over extended geographical areas, and for detecting diseases with long latent phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;

                                                                                                                                                                                                               The invention decsribes a method of differentiating pathogenic and non-pathogenic species of Guignardia (I). The method comprises obtaining a DNA sample from a citrus fruit infected with (I), immobilising the DNA, probing the immobilised DNA with a probe based on intergenic sequences and intronic sequences from within the calmodulin and chitin synthase genes, and demonstrating hybridisation with the probes to represent the pathogenic species and non-pathogenic species. The method is specific, rapid and useful for differentiating pathogenic species (e.g. diugnardia citricarpa, the causative agent of citrus blackspot) from non-pathogenic species of Guignardia. This sequence represents a primer used to isolate an internal transcribed spacer to allow characterisation of pathogenic
hybridization between DNA from Guignardia- infected citrus and sed on intronic sequences from calmodulin and chitin synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

Differentiating pathogenic and non-pathogenic Guignardia sp., by assessing hybridization between DNA from Guignardia- infected citrus and probes based on intronic sequences from calmodulin and chitin synthase genes.

Example 1; Page 20; 37pp; English.

The invention decsribes a method of differentiating pathogenic and non-pathogenic species of Guignardia (I). The method comprises obtaining a DNA sample from a citrus fruit infected with (I), immobilising the DNA, probing the immobilised DNA with a probe based on intergenic sequences and intronic sequences from within the calmodulin and chitin synthase genes, and demonstrating hybridisation with the probes to represent the

The activity of peptides of the invention may be described as cerebroprotective, analgesic, anticonvulsant, neuroleptic, antiparkinsonian, cytostatic, nootropic and neuroprotective. Peptides of the invention are neuronal nicotinic acetylcholine receptor (nAChR) inhibitors. The alpha-conotoxin-like peptide is useful for treating a condition mediated by a neuronal nicotinic acetylcholine receptor, e.g. stroke, pain (e.g. cancer related pain, post-surgical pain, oral or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New alpha- conotoxin-like peptides that inhibit the activity of neuronal nicotinic acetylcholine receptor, useful for treating stroke, pain, schizophrenia, Parkinson's disease, small cell lung carcinoma or
              rapid and useful for differentiating pathogenic species (e.g. Guignardia citricarpa, the causative agent of citrus blackspot) from non-pathogenic species of Guignardia. dental pain, referred trigeminal neuralgia, post-herpetic neuralgia, phantom limb pain, fibromyalgia, reflex sympathetic dystrophy, pain associated with inflammatory conditions, rheumatoid arthritis or inflammatory arthritis, or pain resulting from conditions associated with neurogenic or neuropathic pain), epilepsy, nicotine addiction, schizophrenia, Parkinson's disease, small cell lung carcinoma, or Alzheimer's disease. The alpha-conotoxin-like peptide is also useful for accelerating recovery from nerve injury. The peptides are also useful as research reagents for investigating nicotinic acetylcholine receptor physiology and pharmacology. The current sequence represents a PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of finding at least one murine heavy chain variable region (VH)-encoding polynucleotide encoding at least the VH of an antibody having binding specificity for tumourassociated sialylated glycoprotein antigen (TAG-72). The method involves providing at least one test medium containing at least one murine anti-TAG-72 vH-encoding polynucleotide comprising at least one 5'-non-translated region (5'-NYR) of a murine anti-TAG-72 vH-encoding gene. The process is useful in finding at least one murine vH-encoding gene. The

The present invention relates to a method of finding at least one murine heavy chain variable region (VH)-encoding polynucleotide encoding at least the VH of an antibody having binding specificity for tumourlessociated sialylated glycoprotein antigen (TAG-72). The method involves providing at least one test medium containing at least one murine anti-tag-72 VH-encoding polynucleotide comprising at least one 5'-nontragion (5'-NTR) of a murine anti-TAG-72 VH-encoding gene. The process is useful in finding at least one murine VH-encoding gene. The process is useful in finding at least the VH of an antibody having binding specificity for TAG-72. The antibodies against TAG-72 and compositions are useful in treating cancer, in in vivo diagnostic assays, in vivo therapy or radioinmunoguided surgery. The invention is also useful in gene therapy. The present sequence is mouse B72.3/CC92 immunoglobulin heavy chain DNA specific primer used in the exemplification of the
polynucleotide encoding at least the VH of an antibody having binding specificity for TAG-72. The antibodies against TAG-72 and compositions are useful in treating cancer, in in vivo diagnostic assays, in vivo therapy or radicimmunoguided surgery. The invention is also useful in gene therapy. The present sequence is mouse VH alpha TAG DNA specific primer used in the exemplification of the invention.

The oligonuclectides are derived from a gene encoding or regulating expression of a target polypetide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                       respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel composition (a) a first active agent,

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomocleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallersic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to

   pulmonary obstruction, and/or bronchoconstriction and/or lung pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory unflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cycotatic; cystic fibrosis; respiratory disease; pulmonary vasoconstriction; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel composition (a) a first active agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ç
                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antisense; bronchoconstriction; allergy; hyposecretion; pain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a ceta-adrenation equivalent of composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory when the complex condition such as pulmonary vasoconstriction, and condition such as pulmonary vasoconstriction, and condition such as pulmonary vasoconstriction, when the condition condition such as pulmonary vasoconstriction, where the amount of target fibrosis, allergies in cystic fibrosis, allergies, pulmonary when the condition are such as pulmonary experience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of
                          expression of a target polypeptide associated with lung airway or lung dystunction or cancer and can be anti-sense to the corresponding mRNA.
oligonucleotides are derived from a gene encoding or regulating

This invention describes a novel composition (a) a first active agent, comparising oligomuclectides, effective for alleviating bromchoconstriction, respiratory tract inflammation, allergies and bromchoconstriction, respiratory tract inflammation, allergies and reductional adenosine early propered to adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligomuclectides are derived from a gene encoding or regulating cyperide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention has antiallargic, antiinflammacory, antiasthmatic, instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammacory, antiasthmatic, of the invention has antiallargic, antiinflammacory, antiasthmatic, beta-adrenergic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The culmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascocnstriction, with a disease or condition such as pulmonary vascocnstriction, with a disease or condition such as pulmonary vascocnstriction, thypertension, emphysema, chronic obstructive pulmonary disease, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligops corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system of egg., the oligonuclectides into the interest in the interest and the interest and the interest and the

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating comprising oligonuclectides, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regularing dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiakfammatory, antiakfammatory, antiakfammatory, antiakfammatory, antiakfammatory, or onergonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The cumposition and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or inflammation, allergies and/or bronchoconstriction and/or inflammation, allergies and/or bronchoconstriction and/or treating a respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis or cancer. The reduced adenosine content of the anti-sense oligons corresponding to the rangel RNA serves to prevent the breakdown of the oligonuclectication beatt, kidney, etc, tissue environment and thereby, to try bronchocouse that the environment and thereby, to the product of the condition of the toit the delicest adenosine content of the antiance of the oligonuclectides into product that the delices of the oligonuclection and the toit transplanta
                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 15; SEQ ID NO 2264; 763pp; English.

S Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted tnucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent

Claim 15; SEQ ID NO 3189; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, cuffactant depletion or hyposecretion, when administered to a mammal. The cligonuclectides are derived from a gene encoding or regulating configuration of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dystunction also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) activity is a contraction for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, configuratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or bronchoconstriction and/or lung configuration, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, configuration rejection, pulmonary impeded respiration; repliratory configuration rejection, pulmonary impeded respiration; pulmonary configuration rejection, pulmonary impeded respiration; pulmonary configuration rejection, pulmonary interess syndrome, pain, cystic fibrosis, allergic rhimitis, pulmonary to thymidines present in the target RNA serves to prevent the breakdown of the right present in the target RNA serves to prevent the breakdown of thymidines present in the ranget RNA serves to prevent the breakdown of the pulse present in the reduced th thereby, to brain, heart, kidney, etc, tissue environment and unwanted effects due to it lung, brain, heart, prevent any

Pabalan J, Aguilar Katz E,

í,

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted tructeic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 19; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction,

analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. expression of a target polypeptide associated with lung airway or lung

The invention or cancer and can be anti-sense to the corresponding arguery dysfunction or cancer and can be anti-sense to the corresponding arguery and carcer and can be anti-sense; (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, bypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition, ench as pulmonary vasoconstriction, the anismation, allergies, asthma, impeded respiration, respiratory bypertension, emphysema, chronic obstructive pulmonary disease, pulmonary the reduced adenosine content of the anti-sense oligos or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of the oligonucleonia.

e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

; 0

```
inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are spiratory distances or condition such as pulmonary vasoconstriction, respiratory distress syndrome, pain, cystic fibrosis, allergic rhintis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary Transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oliges corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating Claim 15; SEQ ID NO 509; 763pp; English

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and

bronchodilating agent.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The colligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconarication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·.

New antisense compound targeted to a nucleic acid molecule encoding human pituitary tumor-transforming gene useful for prophylaxis of e.g. inflammation and tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antisense compound having a length of 8 - 50 nucleotides and targeted to a nucleic acid molecule encoding human pituliary tumour-transforming gene (PTG1, also known as securin, TUTR1 or ESP-1 associated protein). The antisense oligonucleotides are useful for inhibiting the expression of PTG1 in human cells or tissues, for treating diseases associated with PTTG1, as tools in differential and/or combinatorial analysis to elucidate expression patterns of a portion of the entire complement of genes expressed within cells and tissues, for diagnostics, therapeutics, and prophylaxis of e.g. inflammation, tumour formation and as research reagents and kits. The present sequence is an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antisense oligonucleotide of the invention, targeting human PTTG1

The present invention describes a nucleic acid molecule which encodes a MUC-1 antigen. The nucleic acid is capable of raising an immune response in vivo, has reduced susceptibility to recombination than full-length MUC-1 and comprises between 1 and 15 variable number of tandem repeats (WNTR) perfect repeat units. Also described: (1) a plasmid comprising the DNA molecule; (2) a protein encoded by the nucleic acid, (3) a pharmaceutical composition comprising the nucleic acid, plasmid or protein and an excipient, dilunent or carrier; and (4) a method of treating or preventing tumours or metastases. A MUC1 antigen has cytostatic activity, and can be used in vaccines, and in gene therapy. The nucleic acid is useful for preparing a composition for treating or preventing tumours or metastases. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; E2-EPF; autoimmune disease; skin disease; pemphigus foliaceus; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADG72400/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                           The present invention describes a nucleic acid molecule encoding a MUC-1 derivative that is devoid of all perfect repeats. Also described: (1) a plasmid comprising the DNA molecule; (2) a protein encoded by a nucleic acid molecule; (3) a pharmaceutical composition comprising the nucleic acid, the plasmid or the protein and a pharmaceutical acceptable excipient, diluent or carrier; and (4) a method of treating or preventing tuncheic acid, plasmid, a protein carrier and can be used in vaccines. The nucleic acid, plasmid, a protein or the pharmaceutical composition of the protein can be used in the preparation of a medicament for the treatment or prevention MUC-1 expressing tuncurs. The tunour can be carcinomas of the breast, lung, gastric or other gastrointestinal carcinomas. The tuncleic acid vaccines are easy to produce in large quantities compared over conventional protein vaccination. Seen at small doses they have been reported to induce strong immune responses and can induce a cytotoxic T lymphocyte immune response as well as an antibody response. The present

The invention relates to a compound targeted to, and which specifically hybridises with, a nucleic acid molecule encoding E2-EPF, and that inhibits the expression of E2-EPF. The compound, composition and methods are useful for treating a disease or condition associated with E2-EPF, seuch as an autoimmune disease, preferably a skin disease such as pemphigus foliaceus. They are also useful in research and diagnostics for modulating the expression of E2-EPF. The present sequence represents a human E2-EPF antisense oligonucleotide.
                                                                                                                 E2-EPF; autoimmune disease; skin disease; pemphigus foliaceus; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotide targeted to a nucleic acid encoding E2-EPF, useful for treating an autoimmune disease, preferably a skin disease, such as, pemphigus foliaceus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; E2-EPF; autoimmune disease; skin disease; pemphigus foliaceus; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a compound targeted to, and which specifically hybridises with, a mucleic acid molecule encoding EO-EPF, and that inhibits the expression of E2-EPF. The compound, composition and methods are useful for treating a disease or condition associated with E2-EPF, such as an autoimmune disease, preferably a skin disease such as pemphigus foliaceus. They are also useful in research and diagnostics for modulating the expression of E2-EPF. The present sequence represents a human E2-EPF target region.

The invention relates to an antisense oligonucleotide comprising 8-80 nucleobases in length targeted to the coding region of a nucleic acid molecule encoding PPAR-delta (peroxisome proliferative activated receptor delta), where the antisense compound inhibits the expression of the PPAR-delta and has any of the 66 sequences of 20 amino acids fully defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 16; SEQ ID NO 262; 155pp; English.

The invention relates to a compound targeted to, and which specifically hybridises with, a nucleic acid molecule encoding E2-EPF, and that inhibits the expression of E2-EPF. The compound, composition and methods are useful for treating a disease or condition associated with E2-EPF, such as an autolimmune disease, preferably a skin disease such as pemphigus foliaceus. They are also useful in research and diagnostics for modularing the expression of E2-EPF. The present sequence represents a New antisense oligonucleotide targeted to a nucleic acid encoding E2-EPF, useful for treating an autoimmune disease, preferably a skin disease, such as, pemphigus foliaceus. New antisense oligonucleotides of 8-80 nucleobases, useful for treating cancer, diabetes, osteoporosis or various endocrine disorders. Gaps ; 0.8%; Score 14.2; DB 1; Length 20; 84.2%; Pred. ```
The invention relates to an antisense oligonucleotide comprising 8-80 nucleobases in length targeted to the coding region of a nucleic acid molecule encoding PPAR-delta (peroxisome proliferative activated receptor delta), where the antisense compound inhibits the expression of the PPAR-delta delta and has any of the 66 sequences of 20 amino acids fully defined in the specification. Also included are a compound of 8-80 nucleobases in length that specifically hybridises with at least an 8-nucleobase portion of a preferred target region on a nucleic acid molecule encoding PPAR-delta and a composition comprising the antisense oligonucleotide and a carier. The antisense oligonucleotide comprises at least one modified internucleoside linkage (preferably 2'-O-methoxyethyl moiety) and at least one modified nucleobase (which is a 5-methyl cytosine). The antisense compounds are useful for treating cancer, osteoporosis, diabetes or various endocrine disorders. The Human PPAR delta gene is located on chromosome 6p21. The present sequence is an antisense oligonucleotide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel antisense compound targeted to a nucleic acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B. The compound of the invention demonstrates antiarteriosclerotic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    anorectic, lipid; cholesterol metabolism; atherosclerosis; diabetes Type 2; obesity; hyperlipidaemia; cardiovascular; gene therapy; antisense; 2'-0-methoxyethyl gapmer; phosphorothioate backbone; 2'-MOE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ID 420.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        apolipoprotein B; ApoB; antiarteriosclerotic; cardiant; antidiabetic;

cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the 2'-O-methoxychthyl (2'-MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a phosphorothioate backbone throughout and in which all cytidine residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B. The compound of the invention demonstrates antiarteriosclerotic, cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the human ApoB antisense inhibition target DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel antisense compound targeted to a nucleic

The compound of the invention demonstrates antiarteriosclerotic, cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the 2'-O-methoxyethyl (2'-MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for treating

                                                                                                                                                                                                                                                                                                                                                        The present invention relates to antisense compounds targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6 (GRK6). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of GRK6. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5'-methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as rheumatoid arthritis, drug addiction, uterine contractility, hypertension, and diseases or conditions arising from aberrant
                                                                                New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding G protein-coupled receptor (GPCR) kinase 6, useful for treating diabetes, drug addiction, uterine contractility and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                 to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                  New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetees; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2 - methoxyethyl; 2 '-MOE.

to nucleic acids encoding a mammalian glucocorticoid receptor. The antiense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                             New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardious formation; hyperlipidemia; Cushing's syndrome; human; ss; phosphorothicate backbone; 2-methoxyethyl; 2.-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises an antisense oligonucleotides that are targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human glucocorticoid receptor-specific antisense oligonucleotide #4237
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocotticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                            to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, present DNs sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding VEGF-C, and inhibits the expression of VEGF-C. The compound, composition and methods are useful for treating a disease or condition associated with VEGF-C, such as a cardiovascular disorder e.g. atherosclerosis or diabetic retinopathy or an autoimmune or inflammariory disorder. They are also useful in research and diagnostics for modulating the expression of VEGF-C. The present sequence represents a human VEGF-C PCR primer.

The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2-0-methoxyethyl (2-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified antisense oligonucleotide further comprises at least one modified outleobase, preferably a 5-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  methylcytosine. The antisense oligonucleotides are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer, autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents a human IRAK-1 DNA target sequence for an
                                                                                                                                                               Antisense therapy, human, interleukin-1 receptor-associated kinase-1, IL-1 receptor-associated kinase-1, IRAK-1, hyperprofilerative disorder e.g.; cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compound having a sequence targeted to a nucleic acid encoding IL-1 receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 15; SEQ ID NO 127; 66pp; English.
                                                                                                                        DNA target sequence #42.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to antisense compounds targeted to a nucleic acid encoding interleukin-1 (IL-1) receptor-associated kinase-1 (IRAK-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of IRAK-1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified sugar moiety, preferably a 2'-0- It also comprises at least one modified sugar moiety, preferably a 2'-0- methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further methotycosine. The antisense oligonucleotide further methylotycosine. The antisense oligonucleotide further methylotycosine. The antisense oligonucleotide are useful for the treatment of diseases such as hyperproliferative disorders, e.g. cancer, treatment of diseases such as hyperproliferative disorders, e.g. cancer,
                                                                                                                                          Antisense therapy, human, interleukin-1 receptor-associated kinase-1, IL-1 receptor-associated kinase-1, IRAK-1; hyperproliferative disorder e.g., cancer; autoimmune disorder; altered bone metabolism or inflammation; cytostatic; immunosuppressive; osteopathic; antiinflammatory; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New compound having a sequence targeted to a nucleic acid encoding IL-1 receptor-associated kinase-1, useful for preparing a composition for treating hyperproliferative or autoimmune disorder or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothicate
/note= "This oligonucleotide has a phosphorothicate
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length at each
end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     autoimmune disorders, altered bone metabolism, and inflammation. The present sequence represents an antisense oligonucleotide used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

the initial stage concentration of the first culture medium. A reagent destroying microbial cells is added to the culture medium. A reagent culture completion. The microbial cells are lysed and the residual dioxin concentration of both the culture medium are compared. The basidiomycete having the dioxin degrading activity is selected by screening, which involves selecting the microorganisms in which the residual dioxin concentration of the first culture medium is less than the residual dioxin concentration of the second culture medium. ADH61959-ADH61961 are tibosomal DNAs from Panellus stypticus used to determine the genus of the basidiomycetes used in the method of the invention. ADH61955-ADH61958 are PCR primers used to amplify the rDNA sequences in an example from the using basidiomycete such as Panellus stypticus having using decomposable basidiomycetes (Panellus stypticus). In (M1), the basidiomycete is cultured in a first culture medium containing dioxin and in a second culture medium not containing dioxin. The dioxin is added to the second culture medium such that its concentration becomes equal to cytostatic; cardiant; antiinflammatory; antimicrobial; antisense therapy; bhosphodiesterase 4D; cancer; cardiovascular disease; inflammation; inflection; inflammation; tumour formation; antisense technology; human; ss. The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonucleotide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer This sequence represents a human cyclin dependent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                    The invention describes a compound 8-80 mucleobases in length targeted to a nucleic acid molecule encoding phosphodiesterase 4D. The compound specifically hybridises with the nucleic acid molecule encoding phosphodiesterase 4D. The acid molecule encoding phosphodiesterase 4D, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding phosphodiesterase 4D. The expression of phosphodiesterase 4D. The expression of phosphodiesterase 4D, and for treating diseases or conditions associated with expression of phosphodiesterase 4D, e.g. cancer, cardiovascular disease or inflammation. The antisense compounds are also useful as research reapplications, e.g. to prevent or delay infection, inflammation or tummour formation. This sequence represents a
                                                                                                                                                                                                               New antisense compounds targeted to nucleic acid molecules encoding phosphodiesterase 4D, useful for treating diseases associated with expression of phosphodiesterase 4D, e.g. cancer, cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "OTHER= Phosphorothioate backbone.
